 - 系统参数设置&工具使用
 - selinux配置
 - 免密登陆配置
 - DNS 和 NSCD配置
 - hosts file
 - hostname
 - 网络配置
 - 防火墙配置
 - NTP配置(有点问题, 之后再看)
 - 离线yum包安装
 - JAVA安装
 - 安装MySQL
 - 配置Ambari
 - 复制MySQL驱动程序
 - 安装ambari
 - 命令行安装Ambari-server
 - 初始化
 - setup选择
 - 数据库创建 ambari 库
 - 启动服务器
 - 访问界面配置
 - 配置安装完后删除SmartSense
- 遇到的问题
 - ssl问题
 - 安装HDP时, HST Agent Instal安装失败(扩展, 任何一个组件都这样操作)
 - 服务器软连接错误
 - KAFKA 外网连接配置
 - 删除所有老包
 - 宕机重启后 Ambari Metrics 启动失败

系统准备

磁盘准备

将数据盘挂载到 /data 下

```
mount /xxx/xxx/xxx /data
```

包准备

1. ambari-2.7.4.0-centos7.tar.gz
2. ambari.repo
3. cache.tar.gz
4. Centos-7.repo
5. HDP-3.1.4.0-centos7-rpm.tar.gz
6. HDP-GPL-3.1.4.0-centos7-gpl.tar.gz
7. HDP-UTILS-1.1.0.22-centos7.tar.gz
8. hdp.gpl.repo
9. hdp.repo
10. jdk-8u181-linux-x64.tar.gz
11. libxml2-2.9.1-6.el7_2.3.x86_64.rpm
12. mysql-5.7.29-1.el7.x86_64.rpm-bundle.tar
13. rpm-gpg.tar.gz
14. scala-2.11.12.tgz
15. scala-2.12.10.tgz

信息收集

1. 收集主机名 `hostname -f`
2. 列出你想要在每个主机上安装的组件
3. 组建好各个数据目录

系统参数设置&工具使用

1. 修改 /etc/security/limits.conf 添加如下内容

```
* soft nofile 65536
* hard nofile 65536
* soft nproc unlimited
* hard nproc unlimited
```

修改语句：

```
cat << EOF >> /etc/security/limits.conf
* soft nofile 65536
* hard nofile 65536
* soft nproc unlimited
* hard nproc unlimited
EOF
```

2. 修改 /etc/security/limits.d/20-nproc.conf (centos6 /etc/security/limits.d/90-nproc.conf) 文件内容如下

```
*          soft    nproc    unlimited
root      soft    nproc    unlimited
```

selinux配置

1. 一次性修改 `setenforce 0`
2. 永久修改：编辑 /etc/selinux/config 文件，

```
SELINUX=disabled
```

```
sed 's#SELINUX=enforcing#SELINUX=disabled#g' /etc/selinux/config -i
```

3. 修改 /etc/yum/pluginconf.d/refresh-packagekit.conf

```
enabled=0
```

4. umask 配置，ambari和HDP只支持022或者027，如果默认是022或者0022就不用修改，永久修改方法

```
echo "umask 0022" >> /etc/profile
```

免密登陆配置

1. 到 ~/.ssh/ 目录下先用 `ssh-keygen` 命令创建密钥公钥
2. 用 `ssh-copy-id` 进行配置

```
ssh-copy-id hadoop@IP1
ssh-copy-id hadoop@IP2
ssh-copy-id hadoop@IP3
```

3. 测试是否通过

DNS 和 NSCD配置

hosts file

将三台主机和ip添加进 /etc/hosts 文件就可以了

hostname

需要配置成正式域名的样式

```
hostnamectl set-hostname xxx --static
```

网络配置

给 /etc/sysconfig/network 文件添加内容

```
NETWORKING=yes
HOSTNAME=<fully.qualified.domain.name>
```

样例命令

```
cat << EOF >> /etc/sysconfig/network
# Created by anaconda
NETWORKING=yes
HOSTNAME=data1
EOF
```

防火墙配置

```
systemctl disable firewalld
service firewalld stop
```

NTP配置(有点问题，之后再看)

1. 安装 `yum install ntpdate ntp -y`
2. 配置 `vim /etc/ntp.conf`

```

# For more information about this file, see the man pages
# ntp.conf(5), ntp_acc(5), ntp_auth(5), ntp_clock(5), ntp_misc(5), ntp_mon(5).

driftfile /var/lib/ntp/drift
logfile /var/log/ntpd.log

# Permit time synchronization with our time source, but do not
# permit the source to query or modify the service on this system.

# Note: Monitoring will not be disabled with the limited restriction flag.
disable monitor
```

离线yum包安装

JAVA安装

1. 查看是否有自带 open JDK

```
rpm -qa | grep java
```

2. 通过命令删除

```
yum remove "*openjdk*"
```

最好把前面列出来的，一个一个删除
综合shell

```
for i in $(rpm -qa | grep java);do yum remove -y $i;done
```

3. 下载 oracle JDK

[jdk8下载页面](#)

4. tar包安装方式(.tar.gz)

将tar包解压到一个目录下，各人比较喜欢解压到 /opt/run 目录下，然后再通过软连接到 /usr/local/java 这样便于版本更新，再在 /etc/profile 添加环境变量。命令如下：

```
mkdir /opt/binary
tar xzf jdk-8u181-linux-x64.tar.gz -C /opt/binary
ln -s /opt/binary/jdk1.8.0_181 /usr/local/java
cat << EOF >> /etc/profile
#JAVA_HOME
export JAVA_HOME=/usr/local/java
export JRE_HOME=\$JAVA_HOME/jre
export CLASSPATH=.:\$JAVA_HOME/lib:\$JRE_HOME/lib
export PATH=\${PATH}:\${JAVA_HOME}/bin
EOF
```

安装MySQL

1. 先删除自带 mariadb-libs-5.5.60-1.el7_5.x86_64

```
rpm -e --nodeps mariadb-libs-5.5.60-1.el7_5.x86_64
```

2. 按顺序安装包

```
rpm -ivh mysql-community-common-5.7.29-1.el7.x86_64.rpm
rpm -ivh mysql-community-libs-5.7.29-1.el7.x86_64.rpm
rpm -ivh mysql-community-client-5.7.29-1.el7.x86_64.rpm
rpm -ivh mysql-community-server-5.7.29-1.el7.x86_64.rpm
rpm -ivh mysql-community-devel-5.7.29-1.el7.x86_64.rpm
```

3. 启动

```
systemctl start mysqld
```

4. 查看初始化密码

```
grep 'temporary password' /var/log/mysqld.log
```

5. 设置简单密码模式

```
cat "validate_password = off" >> /etc/my.cnf
```

6. 修改密码

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'ewell@123';
```

7. 创建超级用户

```
CREATE USER 'ewell'@'%' IDENTIFIED BY 'ewell@123';
GRANT ALL ON *.* TO 'ewell'@'%';
GRANT all ON *.* TO 'ewell'@'%' WITH GRANT OPTION;
flush privileges;
```

配置Ambari

1. 先配置数据库

```
create database ambari character set utf8;
CREATE USER 'ambari'@'%' IDENTIFIED BY '123456';
GRANT ALL PRIVILEGES ON *.* TO 'ambari'@'%';
FLUSH PRIVILEGES;
create database hive character set utf8;
CREATE USER 'hive'@'%' IDENTIFIED BY '123456';
GRANT ALL PRIVILEGES ON hive.* TO 'hive'@'%';
FLUSH PRIVILEGES;
create database oozie character set utf8;
CREATE USER 'oozie'@'%' IDENTIFIED BY '123456';
GRANT ALL PRIVILEGES ON oozie.* TO 'oozie'@'%';
FLUSH PRIVILEGES;
create database ranger character set utf8;
CREATE USER 'rangeradmin'@'%' IDENTIFIED BY '123456';
GRANT ALL PRIVILEGES ON rangeradmin.* TO 'rangeradmin'@'%';
FLUSH PRIVILEGES;
```

2. 安装httpd服务

```
yum install -y yum-utils createrepo httpd
```

3. 会有目录 /var/www/html 并创建目录

```
mkdir -p /var/www/html/ambari/2.7.4
mkdir -p /var/www/html/hdp/3.1.4
```

4. 将之前下的包都解压到ambari目录下

```
tar xzf ambari-2.7.4.0-centos7.tar.gz -C /var/www/html/ambari/2.7.4
tar xzf HDP-3.1.4.0-centos7-rpm.tar.gz -C /var/www/html/hdp/3.1.4
tar xzf HDP-UTILS-1.1.0.22-centos7.tar.gz -C /var/www/html/hdp/3.1.4
tar xzf HDP-GPL-3.1.4.0-centos7-gpl.tar.gz -C /var/www/html/hdp/3.1.4
```

5. 获取repo配置文件

```
cp ambari.repo /etc/yum.repos.d
cp hdp.gpl.repo /etc/yum.repos.d
cp hdp.repo /etc/yum.repos.d
```

6. 配置repo文件

ambari.repo

```
#VERSION_NUMBER=2.7.4.0-118
[ambari-2.7.4.0]
name=ambari Version - ambari-2.7.4.0
baseurl=http://data1/ambari/2.7.4/ambari/centos7/2.7.4.0-118/
gpgcheck=1
gpgkey=http://data1/ambari/2.7.4/ambari/centos7/2.7.4.0-118/RPM-GPG-KEY/RPM-GPG-KEY-Jenkins
enabled=1
priority=1
```

hdp.repo

```
#VERSION_NUMBER=3.1.4.0-315
[HDP-3.1.4.0]
name=HDP Version - HDP-3.1.4.0
baseurl=http://data1/hdp/3.1.4/HDP/centos7/3.1.4.0-315/
gpgcheck=1
gpgkey=http://data1/hdp/3.1.4/HDP/centos7/3.1.4.0-315/RPM-GPG-KEY/RPM-GPG-KEY-Jenkins
enabled=1
priority=1
```

```
[HDP-UTILS-1.1.0.22]
name=HDP-UTILS Version - HDP-UTILS-1.1.0.22
baseurl=http://data1/hdp/3.1.4/HDP-UTILS/centos7/1.1.0.22/
gpgcheck=1
gpgkey=http://data1/hdp/3.1.4/HDP-UTILS/centos7/1.1.0.22/RPM-GPG-KEY/RPM-GPG-KEY-Jenkins
enabled=1
priority=1
```

hdp.gpl.repo

```
#VERSION_NUMBER=3.1.4.0-315
[HDP-GPL-3.1.4.0]
name=HDP-GPL Version - HDP-GPL-3.1.4.0
baseurl=http://data1/hdp/3.1.4/HDP-GPL/centos7/3.1.4.0-315/
gpgcheck=1
gpgkey=http://data1/hdp/3.1.4/HDP-GPL/centos7/3.1.4.0-315/RPM-GPG-KEY/RPM-GPG-KEY-Jenkins
enabled=1
priority=1
```

7. 生成本地源

```
createrepo /var/www/html/hdp/3.1.4/HDP/centos7/
createrepo /var/www/html/hdp/3.1.4/HDP-UTILS/
```

8. 将 ambari.repo hdp.repo hdp.gpl.repo 三个文件复制到其他机器上

```
for i in $(cat /etc/yum.repos.d/ambari.repo, /etc/yum.repos.d/hdp.repo, /etc/yum.repos.d/hdp.gpl.repo)
```

9. 关闭 gpgcheck

```
echo "gpgcheck=0" >> /etc/yum/pluginconf.d/priorities.conf
```

复制MySQL驱动程序

```
mv mysql-connector-java-5.1.47.jar /usr/share/java/mysql-connector-java.jar
```

安装ambari

命令行安装Ambari-server

```
yum install ambari-server
```

初始化

```
ambari-server setup --jdbc-db=mysql --jdbc-driver=/usr/share/java/mysql-connector-java.jar  
ambari-server setup
```

☐ 添加 setup 安装步骤图

setup选择

如图：

数据库创建 ambari 库

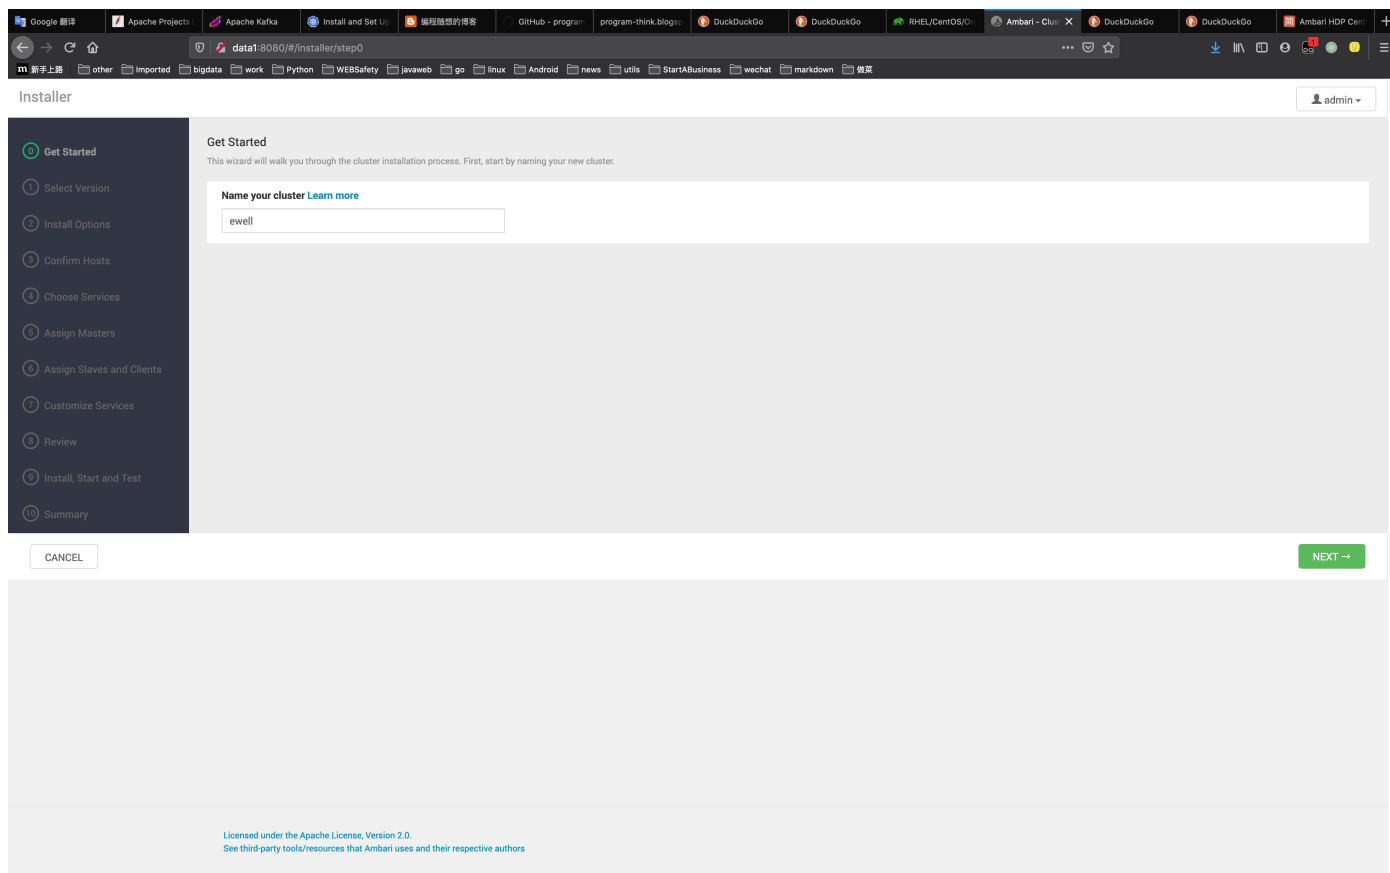

```
mysql -uambari -p ambari < /var/lib/ambari-server/resources/Ambari-DDL-MySQL-CREATE.sql
```

启动服务器

```
ambari-server start
```

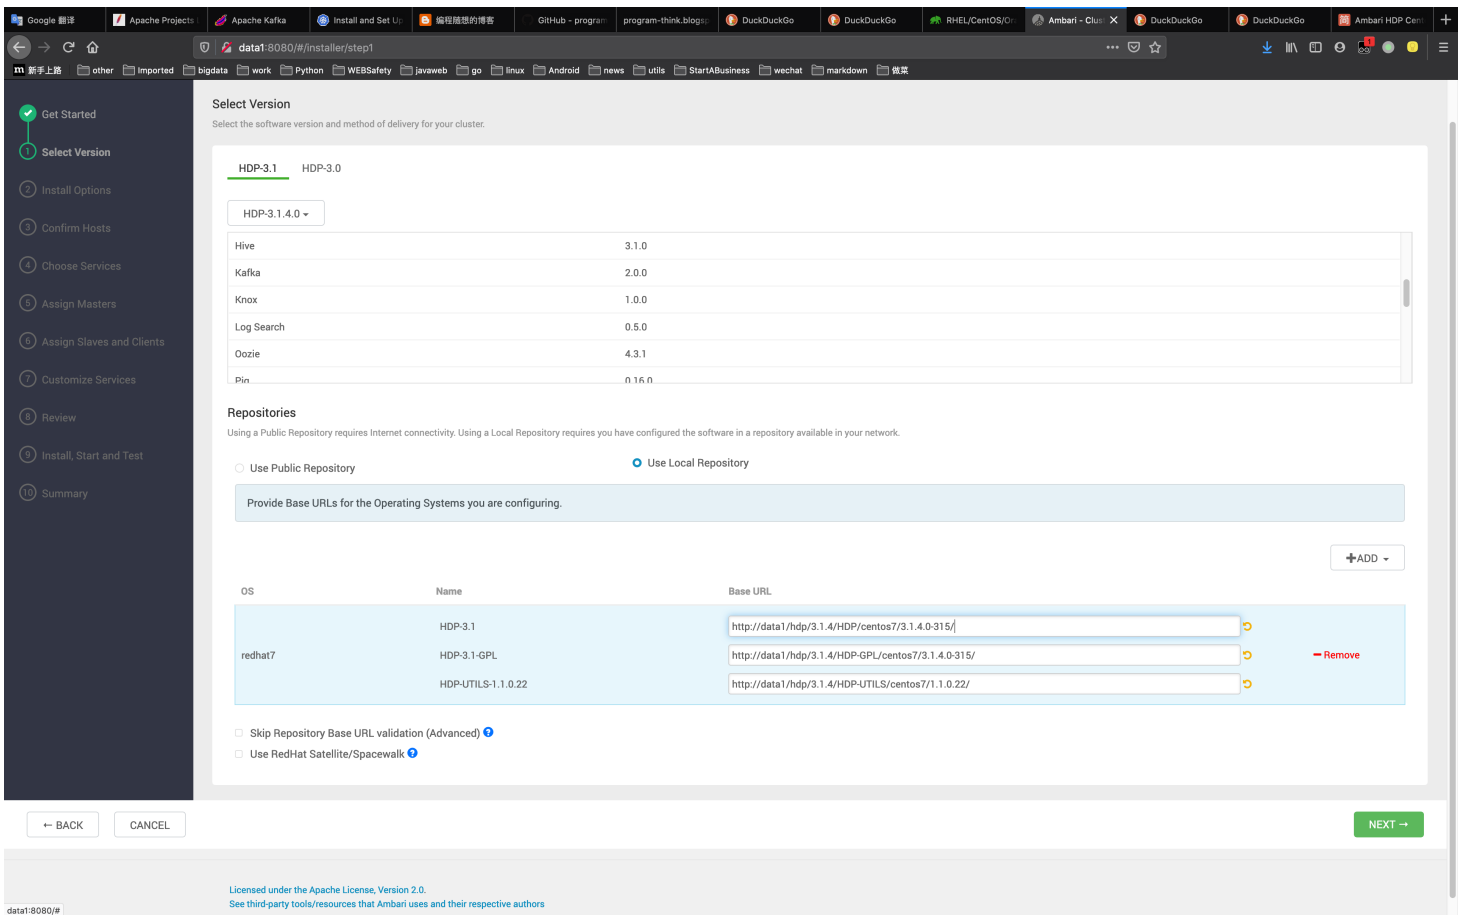

访问界面配置

1. 浏览器输入 `http://data1:8080`
2. 输入用户名密码登录 默认为 `admin admin`
3. GetStart 填入集群名字 `ewell`

4. Select Version 选择 3.1.4 版本,删除其他源只留下 `redhat7` ,配置如下

HDP-3.1	<code>http://data1/hdp/3.1.4/HDP/centos7/3.1.4.0-315/</code>
HDP-3.1-GPL	<code>http://data1/hdp/3.1.4/HDP-GPL/centos7/3.1.4.0-315/</code>
HDP-UTILS-1.1.0.22	<code>http://data1/hdp/3.1.4/HDP-UTILS/centos7/1.1.0.22/</code>

5. Target Hosts 配置 data[1-3]
6. Host Registration Information 配置 Ambari-server 的私钥
7. Confirm Hosts 之前手动安装过 Ambari-agent 就很快
8. 选择配置这些要根据实际需求了
9. 安装各种组件
10. 初始界面
11. 删除 SmartSense

配置安装完后删除SmartSense

由于这个服务是辅助hadoop的并且，没有id就启动不了，而id是官网发放的，所以就干脆删除了

```
curl -u admin:admin -i -H 'X-Requested-By: ambari' -X PUT -d '{"RequestInfo": {"context": "Stop

curl -u admin:admin -i -H 'X-Requested-By: ambari' -X POST -d '{"RequestInfo": {"context": "Unir

curl -u admin:admin -H 'X-Requested-By: ambari' -X DELETE http://data1:8080/api/v1/clusters/ewel
```

遇到的问题

ssl问题

```
etUtil.py:96 - EOF occurred in violation of protocol (_ssl.c:579)
NetUtil.py:97 - SSLError: Failed to connect. Please check openssl library versions.
```

编辑 /etc/ambari-agent/conf/ambari-agent.ini 文件，添加

```
[security]
force_https_protocol=PROTOCOL_TLSv1_2
```

安装HDP时，HST Agent Instal安装失败(扩展，任何一个组件都这样操作)

哪台主机错误，就把对应的软件删除了，然后在页面重装

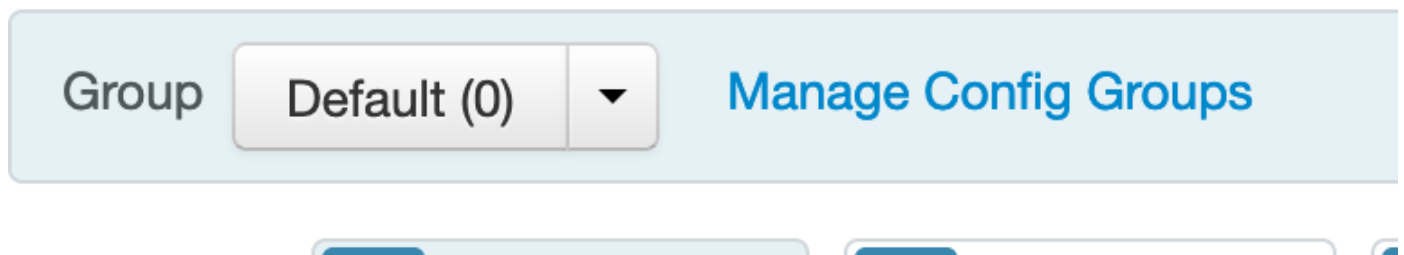

1. yum list | grep xxxx
2. yum remove hadoop*
3. repeat

服务器软连接错误

zookeeper无法安装，服务器文件是在老的软链接

KAFKA 外网连接配置

1. 在kafka配置界面，Manage Config Groups 新增3个组，并且每个分组添加对应服务器

3. 配置结束后，重启

The image shows a screenshot of the Ambari web interface. At the top, a 'Service Actions' dropdown menu is open, displaying the following options: 'Start' (play icon), 'Stop' (red square icon), 'Restart All' (refresh icon, highlighted), 'Restart Kafka Brokers' (clock icon), 'Run Service Check' (thumbs up icon), 'Turn On Maintenance Mode' (wrench icon), and 'Delete Service' (red X icon). Below the menu, a 'Filter' input field is visible. The main content area shows a 'Summary' tab with a 'Configs' sub-tab. The 'Summary' section displays a table with three rows, each showing 'Kafka Broker' status as 'Started' with 'No alerts'. A 'Service Actions' dropdown is also present in the top right corner of the main content area.

删除所有老包

```
yum remove $(yum list installed | grep HDP | awk '{print $1}') -y
```

宕机重启后 Ambari Metrics 启动失败

到主机上，将相关进程强制 kill 之后，再次启动
